

SCHUMACHER "EASY CUT" CUTTING SYSTEM

The Schumacher EASY-CUT Cutting System is commonly fitted as original equipment on many brands, including Claas, Deutz & HoneyBee. It was designed and built as a strong & robust cutting system capable of handling the heavy crops in Western Europe.

The Schumacher Cutting System is modular by design: adaptable to almost any header front available in Australia. The system comprises three main components: the Guards - welded, and bolted top and bottom; the wear bars or bridge rollers; and the knife back.

The knife back is carried on wearbars or bridge rollers, which may be easily and economically changed as required. This allows for extended use of the guards. Sections are bolted "one up, one down". As the knife passes the anvil of the guard, one section will pull the knife up, the next will pull the knife down, which in turn results in a more balanced knife operation, reduced load and stress on the knife drive, superior cutting performance, and a more even wear across the guards & knife.
