G'Day Valued Dealer Network, In This Months November Update We Will Look At Harrows.

Harrows can be used for levelling soil before and after sowing, raking up longer lengths of trash and breaking up large clods of soil as well as covering seeds after sowing. **Australian made high carbon steel** is used to make both the following (Drill) and heavier stump jump harrows.

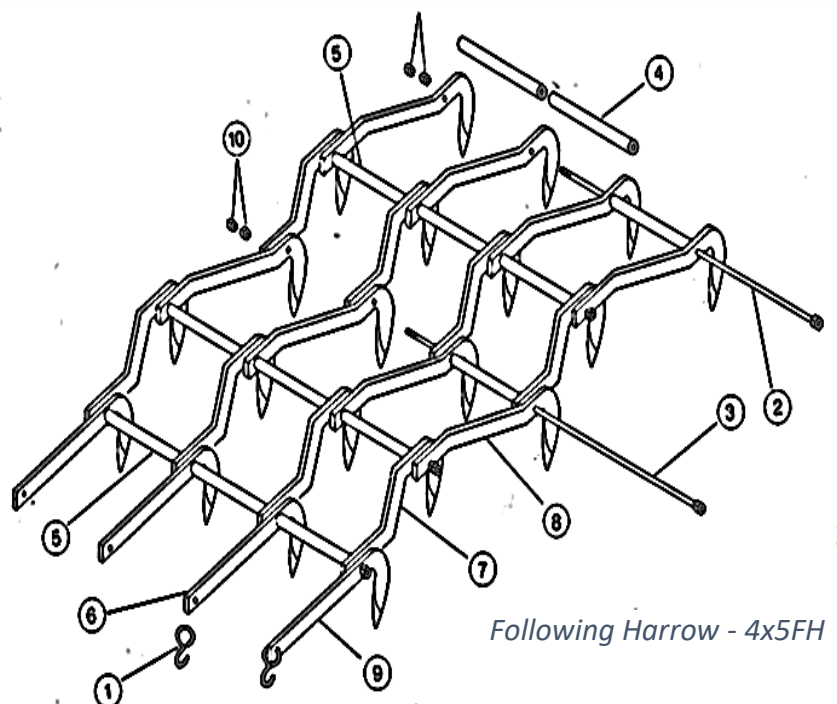

The diamond tips that are working in the soil are heated and forged into a diamond shape to increase the working life. The heavier stump jump harrow can be distinguished by the 2 pull points on the front row. The stump jump is available in the 4x5 size which is 4 rows of tines wide and 5 rows of tines deep. The tine arm is folded in a way that it becomes part of the main frame creating dual pivot surfaces increase the working life of the harrow and increase strength and overall weight.

The following harrows have pull points at the front of every row and are supplied with hooks. They are available in 6 sizes, 3 or 4 rows wide and 3 to 5 rows deep.

All replacement spare parts are available for both series of harrows, as well as a weld on replacement weld on tip to replace worn tips.

Stump Jump - 4x5SJ

Following Harrow - 4x5FH
